Sketching

For this project, I knew I wanted to create a bigger piece than my previous stool. I wanted to create something that had storage and that could be used for multiple purposes. So, I started exploring different ideas. Initially, I had the idea of creating a TV stand with drawers or cabinets, but I realized that the materials provided wouldn't cover the project. Therefore, I began to explore other ideas such as mini tables and monitor stands.

Planning

After reviewing all of my sketches, I began to narrow down my options. At this point, I still wanted to create something big, but I had to consider my current skill level and the amount of time I had available. Eventually, I decided to create a movable desk. To limit expenses, I decided to work only with the materials we were given, which included one 2' x 3' 1/2" in plywood, one 8' 2x4, and any scrap wood we could find. With these limitations in mind, I started to calculate the measurements for each piece. Since I still wanted my piece to have storage, I planned to incorporate a drawer.

Prototyping

Since I had never made a drawer before, I decided to practice and made a mini prototype. To ensure that the pieces aligned properly, I made the front and back pieces wider than the sides. Additionally, I made the bottom piece the largest so that it would support the bottom of all four side pieces. Initially, I had planned to add a handle to the drawer, but then I decided that cut-outs would better match the design. So, I added cutouts to the front and back of the drawer.

To make these round cuts, I used the band saw and then smoothed the cut surface with a chisel. Since there were multiple pieces attaching to one another, and I didn't want screws to show, the best way to assemble the drawer was to use wooden dowels.

Materials & Completed Parts

To maximize my materials, I divided my 8' 2x4 into 4 equal 2' pieces for my legs. I trimmed $\frac{1}{4}$ " from the sides to make them 1 $\frac{1}{2}$ " x 3" for a smoother look. For the desk top and bottom, I cut my plywood in half horizontally, then cut the ends to create two 1' x 2' pieces, leaving two 1' x 1' pieces. I used a panel saw, table saw, and miter saw to cut the materials. To ensure consistency, I smoothed all the wood surfaces and rounded the desk's top and bottom corners. As I didn't have enough time or materials to create a drawer, I decided to make a shelf instead. Additional materials I bought were small corner brackets for the potential shelf and wheels for the bottom of the desk.

Assembly

The assembly process was pretty easy, but time was limited. First, I screwed the legs to the bottom plywood and then to the top. To save time, I attached the wheels next, using smaller screws to avoid piercing the $\frac{1}{2}$ " plywood. Lastly, I added the corner brackets. Unfortunately, due to time constraints, the assembly was not as precise as I would have preferred, and I was unable to attach supports. Nevertheless, the piece was stable and fully functional.

Final Result

Finally, the table is finished. I was hesitant about my design when I started this project, but I am now happy with the final result.

Full “Study on the Go” Set

As the table's design closely resembled the stool I made for project two, I decided they would make an excellent matching furniture set. Both items had straight cuts and gold screws placed in the same locations. The stool also fits perfectly within the empty space of the table, making it easy to store and transport.
